CONVERSION FACTORS

The following table can be used to convert inch-pound units to the International System of units (SI).

<u>Multiply inch-pound units</u>	<u>By</u>	<u>To obtain SI units</u>
<u>Length</u>		
inch (in.)	25.4 0.0254	millimeter (mm) meter (m)
foot (ft)	0.3048	meter (m)
mile (mi)	1.609	kilometer (km)
<u>Area</u>		
square mile (mi^2)	2.590	square kilometer (km^2)
<u>Volume</u>		
gallon (gal)	3.785	liter (L)
<u>Flow</u>		
gallon per minute (gal/min)	0.06309	liter per second (L/s)
<u>Specific capacity</u>		
gallon per minute per foot [(gal/min)/ft]	0.2070	liter per second per meter [(L/s)/m]
<u>Logging speed</u>		
foot per minute (ft/min)	0.00508	meter per second (m/s)

HYDROLOGIC DATA:
SOUTH BRANCH CASSELMAN RIVER, GARRETT COUNTY, AND
MARSH RUN, WASHINGTON COUNTY, MARYLAND

Compiled by John T. Hilleary

ABSTRACT

This report is a compilation of well construction data, lithologic and geophysical logs, and water-level and water-quality data for selected wells and springs in the South Branch Casselman River and Marsh Run drainage basins, Garrett and Washington Counties, Maryland. The report contains, for the two areas combined, records of 202 wells and 57 springs; periodic water-level measurements and field determinations of specific conductance, pH, and water temperature for 33 wells and 7 springs; geophysical logs for 1 well and lithologic logs for 113 wells; and multi-year water-level data for 9 observation wells.

INTRODUCTION

This report is a compilation of well construction data, lithologic and geophysical logs, and water-level and water-quality data for selected wells and springs in the South Branch Casselman River and Marsh Run drainage basins, Garrett and Washington Counties, Md. (Locations of 5-minute quadrangles that include the drainage basins are shown in figure 1.) The report contains, for the two areas combined, records of 202 wells and 57 springs; periodic water-level measurements and field determinations of specific conductance, pH, and water temperature for 33 wells and 7 springs; geophysical logs for 1 well and lithologic logs for 113 wells; and multi-year water-level data for 9 observation wells.

The South Branch Casselman River study area is located in central Garrett County, and has an area of 3.2 mi² (pl. 1). The average basin altitude is about 2,700 ft above sea level; it is a rural area and all water demands are met by private wells or springs. Marsh Run has a drainage area of 18.9 mi² and is located in Washington County (pl. 2). The average basin altitude is about 500 ft, and individual wells or springs supply most domestic and commercial needs, while some areas of the basin are supplied by water from Hagerstown, Md.

The data were collected and compiled as part of a long-range cooperative program to evaluate the water resources of Maryland by the U.S. Geological Survey and the Maryland Geological Survey. The data tables and figures are presented in two parts. The first part contains data from the South Branch Casselman River basin and the second part contains data from the Marsh Run basin.

ACKNOWLEDGMENTS

The author wishes to acknowledge the well drillers, individual homeowners, and colleagues of the U.S. Geological Survey--Michael J. Smigaj, LeRoy L. Knobel, Richard E. Willey, and district surface-water personnel who have given their time and effort to the study. Thanks are due former U.S. Geological Survey hydrologist, Larry J. Nutter, who initiated the project in 1977.

AQUIFERS IN THE DRAINAGE BASINS

Aquifers supplying water to wells, springs, and streams are sedimentary, chiefly sandstone in the South Branch Casselman River drainage basin and limestone in the Marsh Run drainage basin (table 1). Water is present in and moves primarily through the rock fractures (joints and faults) that developed when rocks were stressed by movement of the Earth's crust. These openings may be enlarged by solution, particularly in limestone.

PREVIOUS REPORTS

Amsden, Overbeck, and Martin (1954) described the hydrology of Garrett County; Nutter, Smigaj, and Knobel (1980) reported on water-well records, chemical-quality data and ground-water use in Garrett County. Slaughter (1962) described the water resources of Allegany and Washington Counties, and Nutter (1973) described the hydrogeology of the carbonate rocks in the Frederick and Hagerstown valleys of Maryland.

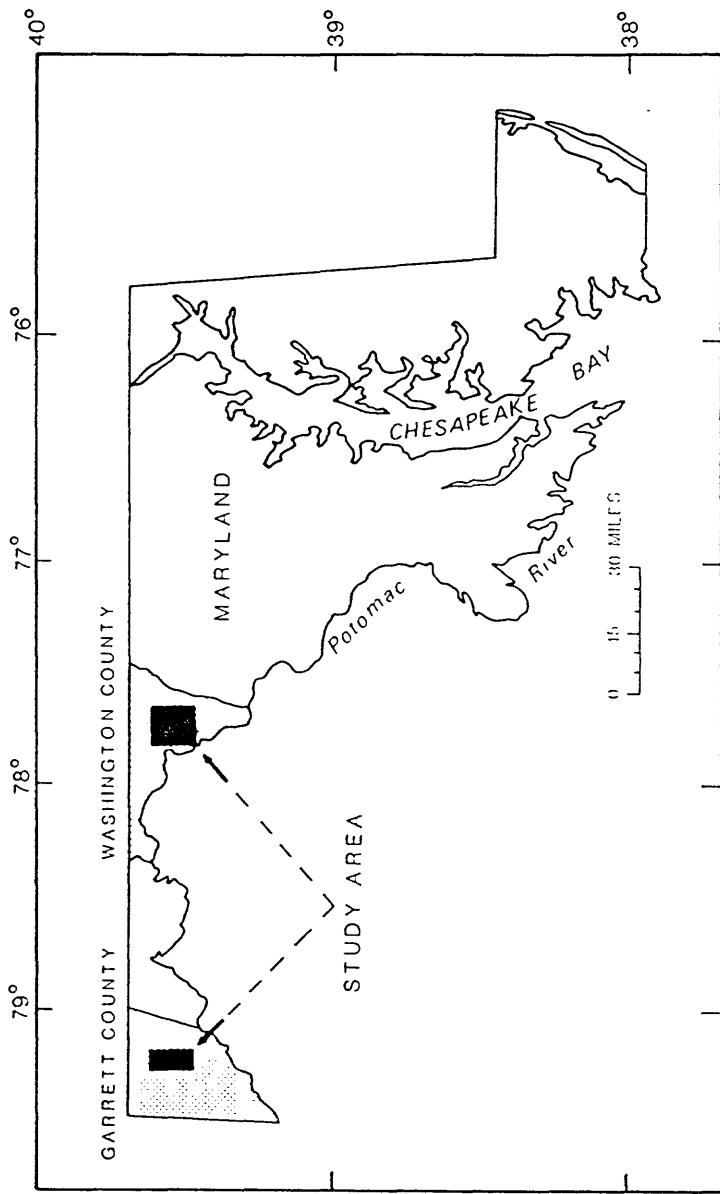

Figure 1.--Map showing locations of 5-minute quadrangles that include the South Branch Casselman River and Marsh Run drainage basins.

Table 1.—Aquifers in the South Branch Casselman River and Marsh Run drainage basins

Code ¹	System	Series	Formation/Group ²	Major rock types
South Branch Casselman River				
321CNMG		Upper	Conebaugh	Sandstone, siltstone, coal
324ALGN	Pennsylvanian	Middle	Allegheny	Sandstone, siltstone
324PSVL			Pottsville	Sandstone, siltstone, coal
331GRBR	Mississippian	Upper	Greenbrier	Sandstone, limestone, shale
Marsh Run				
364STPL		Middle	St. Paul Group	Limestone, dolomitic limestone
367BKMN	Ordovician	Lower	Beekmantown Group	Limestone, dolomite
367SNNG			Stonehenge	Limestone
367RCKR			Rockdale Run	Limestone, dolomite
371CCCCG	Cambrian	Upper	Conococheague	Limestone, conglomerate

¹ Aquifer codes used in well and spring record tables.

² Stratigraphic nomenclature used in this report is that of the Maryland Geological Survey and does not necessarily follow usage of the U.S. Geological Survey.

WELL- AND SPRING-NUMBERING SYSTEM

Wells and springs in Maryland are identified and located using a system adopted by the Maryland Geological Survey. The first two letters of the identification number are county prefixes (GA for Garrett; WA for Washington). The second set of two letters designates one of the 5-minute quadrangles into which the county is divided; the first letter denotes a 5-minute segment of latitude and the second letter identifies a 5-minute segment of longitude. Wells and springs are sequentially numbered within each 5-minute quadrangle; thus, well GA BD 15 is the 15th well inventoried in the BD quadrangle in Garrett County.

WELL AND SPRING RECORDS

Records of 53 wells and 40 springs in the South Branch Casselman River area are contained in tables 2 and 3, respectively. Locations of these data sites are shown on plate 1. Periodic water-level measurements and field determinations of specific conductance, pH, and temperature made at 33 wells and 7 springs are shown in table 4. Water levels in observation well GA CD 28 are shown in table 5 and as a hydrograph in figure 2. Geophysical logs for observation well GA CD 28 are shown in figures 3 to 6. Lithologic logs for 18 wells are contained in table 6.

Records of 149 wells and 17 springs in the Marsh Run area are shown in tables 7 and 8. Locations are shown on plate 2. Water-level data for eight observation wells are shown in tables 9 to 16. Hydrographs for WA CH 106, WA CI 1, and WA CI 82 are shown in figures 7 to 9. Lithologic logs for 95 wells are reported in table 17.

STREAM-DISCHARGE RECORDS

A continuous record of stream discharge for the South Branch Casselman River near Bittinger, Md. (station 03077940), is available from October 1976 to November 1981 (U.S. Geological Survey, 1980, p. 306-310; 1981, p. 375). Continuous records of water temperature and specific conductance (November 1980 to September 1981) are contained in U.S. Geological Survey Water Resources Data for Maryland and Delaware, 1981, p. 377-379. Data on selected chemical concentrations in water and sediment are found in U.S. Geological Survey Water Resources Data for Maryland and Delaware, 1980, p. 311-312; 1981, p. 376.

Stream-discharge data for Marsh Run at Grimes, Md. (station 01617800), are available from October 1963 to the present. The data are published annually (U.S. Geological Survey Water Resources Data for Maryland and Delaware, 1970, p. 606-607; 1971, p. 88; 1972, p. 91; 1973, p. 86; 1974, p. 84; 1975, p. 102; 1976a, p. 674-676; 1976b, p. 197; 1977, p. 195; 1978, p. 168; 1979, p. 204; 1980, p. 213; 1981, p. 292; 1982, p. 206; 1983, p. 162).
